Decision Tree Learning

CS4780/5780 – Machine Learning Fall 2013

> Thorsten Joachims Cornell University

Reading: Mitchell Sections 2.1-2.3, 2.5-2.5.2, 2.7, Chapter 3

Supervised Learning

- Task
 - Learn (to imitate) a function f: X → Y
- · Training Examples:

 - An example is a pair (x, f(x)), where x is the input and f(x) is the output of the function applied to x.
- Goal:
 - Find a function

 $h: X \rightarrow Y$

that approximates

as well as possible.

Hypothesis Space

	correct (complete, partial, guessing)	color (yes, no)	original (yes, no)	presentation (clear, unclear)	binder (yes, no)	A+
1	complete	yes	yes	clear	no	yes
2	complete	no	yes	clear	no	yes
3	partial	yes	no	unclear	no	no
4	complete	ves	ves	clear	ves	ves

Instance Space X: Set of all possible objects described by attributes.

Target Function f: Maps each instance $x \in X$ to target label $y \in Y$ (hidden).

Hypothesis h: Function that approximates f.

Hypothesis Space H: Set of functions we allow for approximating f.

 $\label{thm:continuous} \textbf{Training Data S:} \ \textbf{Set of instances labeled with target function } f.$

Inductive Learning Strategy

- Strategy and hope (for now, later theory):
 Any hypothesis h found to approximate the target function f well over a sufficiently large set of training examples S will also approximate the target function well over other unobserved examples.
- Can compute:
 - A hypothesis $h \in H$ such that h(x)=f(x) for all $x \in S$.
- Ultimate Goal:
 - A hypothesis $h \in H$ such that h(x)=f(x) for all $x \in X$.

Consistency

Definition: A hypothesis h is **consistent** with a set of training examples S if and only if h(x) = y for each training example $(x,y) \in S$.

 $Consistent(h, S) \equiv [\forall (x, y) \in S : h(x) = y]$

1 complete yes yes clear no yes 2 complete no yes clear no yes 3 partial yes no unclear no no		correct (complete, partial, guessing)	color (yes, no)	original (yes, no)	presentation (clear, unclear)	binder (yes, no)	A+
	1	complete	yes	yes	clear	no	yes
3 partial yes no unclear no no	2	complete	no	yes	clear	no	yes
	3	partial	yes	no	unclear	no	no
4 complete yes yes clear yes yes	4	complete	yes	yes	clear	yes	yes

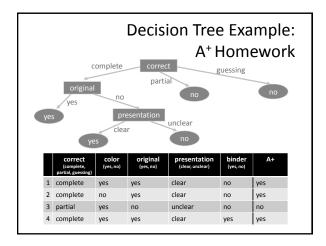

Version Space

Definition: The **version space**, $VS_{H,S}$, with respect to hypothesis space H and training examples S, is the subset of hypotheses from H consistent with all training examples in S.

 $VS_{H,S} \equiv \{h \in H | Consistent(h,S)\}$

List-Then-Eliminate Algorithm

- init VS ← H
- For each training example $(x, y) \in S$
 - remove from VS any hypothesis h for which h(x) ≠ y
- Output VS

Top-Down Induction of DT (simplified)

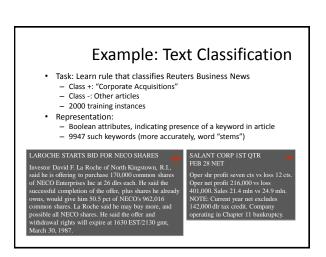

Training Data: $S = ((\vec{x}_1, y_1), \dots, (\vec{x}_n, y_n))$

$TDIDT(S, y_{def})$

- IF(all examples in S have same class y)
- Return leaf with class y (or class y_{def} , if S is empty)
- ELSE
 - Pick A as the "best" decision attribute for next node
 - FOR each value v_i of A create a new descendent of node
 - $S_i = \{ (\vec{x}, y) \in S : \text{attribute } A \text{ of } \vec{x} \text{ has value } v_i \}$
 - Subtree t_i for v_i is TDIDT($S_{ij}y_{def}$)
 - RETURN tree with A as root and t_i as subtrees

$\begin{array}{c} \text{Example: TDIDT} \\ \text{TDIDT}(S, y_{def}) \\ \bullet | \text{IF}(\text{all ex in } S \text{ have same } y) \\ -\text{Return leaf with class } y \\ \text{(or class } y_{def} \text{ if } S \text{ is empty}) \\ \bullet \text{ELSE} \\ -\text{Pick } A \text{ as the "best" decision} \\ \text{attribute for next node} \\ -\text{FOR each value } v_i \text{ of } A \text{ create a new} \\ \text{descendent of node} \\ \bullet S_i = \{(\vec{x}, y) \in S: \text{ attr } A \text{ of } \vec{x} \text{ has val } v_i)\} \\ \bullet \text{Subtree } t_i \text{ for } v_i \text{ is TDIDT}(S_p y_{def}) \\ -\text{RETURN tree with } A \text{ as root and } t_i \text{ as} \\ \text{subtrees} \end{array}$

Which Attribute is "Best"? [29+, 35-] [29+, 35-] [29+, 35-] [29+, 35-] [29+, 35-] [29+, 35-] [29+, 35-] [29+, 35-] [21+, 5-] [29+, 35-] [11+, 2-]
