Optimal Hyperplanes

- Assumption:
 - Training examples are linearly separable.

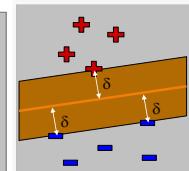

Hard-Margin Separation

- Goal:
 - Find hyperplane with the largest distance to the closest training examples.

Optimization Problem (Primal):

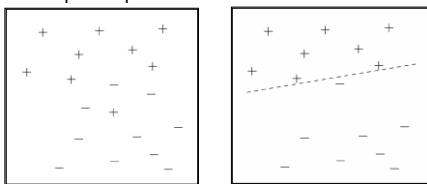

$$\begin{aligned} \min_{\vec{w}, b} \quad & \frac{1}{2} \vec{w} \cdot \vec{w} \\ \text{s.t.} \quad & y_1(\vec{w} \cdot \vec{x}_1 + b) \geq 1 \\ & \dots \\ & y_n(\vec{w} \cdot \vec{x}_n + b) \geq 1 \end{aligned}$$

- Support Vectors:
 - Examples with minimal distance (i.e. margin).

Non-Separable Training Data

- Limitations of hard-margin formulation
 - For some training data, there is no separating hyperplane.
 - Complete separation (i.e. zero training error) can lead to suboptimal prediction error.

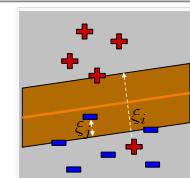

Soft-Margin Separation

Idea: Maximize margin and minimize training

$$\begin{aligned} \text{Hard-Margin OP (Primal):} \quad & \min_{\vec{w}, b} \frac{1}{2} \vec{w} \cdot \vec{w} \\ \text{s.t.} \quad & y_1(\vec{w} \cdot \vec{x}_1 + b) \geq 1 \\ & \dots \\ & y_n(\vec{w} \cdot \vec{x}_n + b) \geq 1 \end{aligned}$$

$$\begin{aligned} \text{Soft-Margin OP (Primal):} \quad & \min_{\vec{w}, \xi, b} \frac{1}{2} \vec{w} \cdot \vec{w} + C \sum_{i=1}^n \xi_i \\ \text{s.t.} \quad & y_1(\vec{w} \cdot \vec{x}_1 + b) \geq 1 - \xi_1 \wedge \xi_1 \geq 0 \\ & \dots \\ & y_n(\vec{w} \cdot \vec{x}_n + b) \geq 1 - \xi_n \wedge \xi_n \geq 0 \end{aligned}$$

- Slack variable ξ_i measures by how much (x_i, y_i) fails to achieve margin δ
- $\sum \xi_i$ is upper bound on number of training errors
- C is a parameter that controls trade-off between margin and training error.

Controlling Soft-Margin Separation

- $\sum \xi_i$ is upper bound on number of training errors
- C is a parameter that controls trade-off between margin and training error.

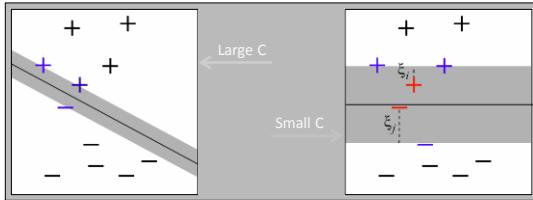

Soft-Margin OP (Primal):

$$\min_{\vec{w}, \xi, b} \frac{1}{2} \vec{w} \cdot \vec{w} + C \sum_{i=1}^n \xi_i$$

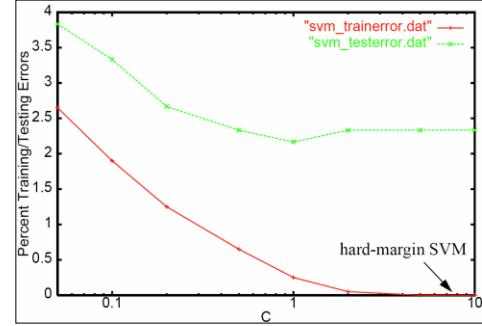

$$\text{s.t. } y_1(\vec{w} \cdot \vec{x}_1 + b) \geq 1 - \xi_1 \wedge \xi_1 \geq 0$$

$$\dots$$

$$y_n(\vec{w} \cdot \vec{x}_n + b) \geq 1 - \xi_n \wedge \xi_n \geq 0$$
