4

Disclaimer

	2000	2010
Workstation speed	266 MHz	> 3 GHz
Lycos used	Yes	?
Queries / day	10 million	400 million
Size of the internet	?	5 million TB

4/8/2010 Agglomerative clustering of a search engine query log

5

Motivation

- Query log analysis
 - Identifying late-breaking trends
- Clustering URLs
 - Generating ontology, organizing bookmarks, grouping search results
- Clustering queries
 - Query recommendations

4/8/2010 Agglomerative clustering of a search engine query log

6

Content ignorant

- Traditional approach
 - Extract feature vector from document
- Content ignorant approach
 - Less computationally expensive
 - Handle text-free pages, pages with restricted access or dynamic content

Graph-based Iterative Clustering

- Graph construction
- Similarity measure
- Iterative clustering
- Complexity / Optimization

Graph Construction

- Input: Query / URL pairs
- Each distinct query becomes a white node
- Each distinct URL becomes a black node
- For each pair, add an edge between the corresponding nodes

Example

(Jean-Baptiste Jeannin, facebook.com/people/Jean-Baptiste)
 (Jean-Baptiste Poquelin, en.wikipedia.org/wiki/Molière)
 (Moliere, en.wikipedia.org/wiki/Molière)
 (Moliere, imdb.com/title/tt0796335/)
 (Moliere, imdb.com/title/tt0016804/)
 (Don Juan, imdb.com/title/tt0016804/)
 (Don Juan, en.wikipedia.org/wiki/Molière)
 (Don Juan, imdb.com/title/tt0796335/)
 (Jane Winton, imdb.com/title/tt0016804/)
 (Fabrice Luchini, imdb.com/title/tt0796335)
 (---, imdb.com/title/tt0796335)
 (---, imdb.com/title/tt0796335)

Similarity measure

$$\sigma(x, y) \stackrel{\text{def}}{=} \begin{cases} \frac{\mathcal{N}(x) \cap \mathcal{N}(y)}{\mathcal{N}(x) \cup \mathcal{N}(y)}, & \text{if } |\mathcal{N}(x) \cup \mathcal{N}(y)| > 0 \\ 0, & \text{otherwise} \end{cases}$$

Similarity measure

	JB Jeanin	JB Poquelin	Moliere	Don Juan	Jane Winton
JB Jeanin	1	0	0	0	0
JB Poquelin		1	1/3	1/3	0
Moliere			1	1	1/3
Don Juan				1	1/3
Jane Winton					1

Iterative Clustering

- Repeatedly merge the most similar pair, alternating between queries and URLs
- Until some stopping criterion is met
- Iterative approach helps to group queries (or URLs) that are otherwise uncorrelated

4/8/2010 Agglomerative clustering of a search engine query log

13

Complexity

- Naïve analysis: $\Theta(n_w^2 + n_b^2)r$ iteration
- Incremental computation of distances
 - Compute only non-zero distances

$$\underbrace{(n_w + n_b) |\mathcal{N}|_{\max}^2}_{\text{One-time computation}}$$

- Re-compute only distances that are susceptible to have changed

$$\underbrace{m(4|\mathcal{N}|_{\max})}_{\text{per iteration}}$$

4/8/2010 Agglomerative clustering of a search engine query log

14

Experiment: Query Recommendations

- Comparing 3 methods for building suggestion lists:
 - Baseline
 - Full-replacement
 - Hybrid
- Measure performance by clickthrough rate

4/8/2010 Agglomerative clustering of a search engine query log

15

Data

- Learning data: 500,000 query/URL pairs
- Test data: around 6 million impressions for each method

4/8/2010 Agglomerative clustering of a search engine query log

16

Results

period	strategy	impressions	clicks	clickthrough rate
April 7-8	baseline	6,120,943	71138	1.16%
April 14-15	hybrid	6,058,757	79515	1.31%
April 21-22	full replacement	5,985,997	61377	1.03%

4/8/2010 Agglomerative clustering of a search engine query log

17

Discussion

- Similarity metric limitation
 - Two URLs shared should be better than one
 - More clicks should mean better correlation
 - Sensitivity to noisy clickthroughs

➔ Adding weights to edges
 “Clustering Search Engine Query log containing noisy clickthroughs”, Wing Shun Chan et al., 2004.

4/8/2010 Agglomerative clustering of a search engine query log

18

Discussion

- Quality of the search engine
 - Clustering only as good as the search engine itself
 - Perhaps, it might possibly improve the search experience, and the IR.

Discussion

- Limitation of experiments
 - Clickthrough does not reflect the quality of clustering
 - Users are likely to prefer search refinements over related searches
